

Experiment 1

Module Name: Robot Framework

Experiment Title: Basic Syntax and Keywords

Problem Statement: Create a Robot Framework test case to open a web browser and navigate to a specific URL. Use the "Input Text" keyword to fill in a form field on a webpage. Write a test case to verify the presence of a specific element on a webpage using the "Page Should Contain Element" keyword.

Objective: To understand the basic syntax of Robot Framework, import external libraries (Selenium Library), and utilize built-in keywords for browser manipulation and DOM validation.

Tools, Software, and Concepts Used: Robot Framework, Selenium Library Keywords: Open Browser, Input Text, Page Should Contain Element

Source Code / Implementation Steps:

1. Create a Folder Inside that Folder make a file experiment1.robot and write this:

```
*** Settings ***
Library      SeleniumLibrary

*** Variables ***
${URL}       https://www.saucedemo.com/
${BROWSER}   Chrome

*** Test Cases ***
Verify Login Page Elements And Input Data
    [Documentation]    Opens the browser, inputs text, and verifies an
    element.
    Open Browser       ${URL}       ${BROWSER}
    Maximize Browser Window
    Page Should Contain Element    id=login-button
    Input Text              id=user-name    standard_user
    Close Browser
```

2. Now from the folder go to cmd and write >>> robot experiment1.robot

Output with clearly labelled screenshots:

The screenshot displays the Robot Framework log.html report for 'Experiment1 Log'. The browser address bar shows the file path 'D:\My%20Desktop\Robot%20Project\log.html'. The report includes a 'REPORT' button in the top right corner.

Execution Log

```
SUITE: Experiment1
Full Name: Experiment1
Source: D:\My Desktop\Robot Project\experiment1.robot
Start / End / Elapsed: 20260920 19:30:10.853 / 20260920 19:30:21.158 / 00:00:10.305
Status: 1 test total, 1 passed, 0 failed, 0 skipped

+ TEST: Verify Login Page Elements And Input Data
```

Screenshot 1: Page of log.html

Screenshot 2: Page of report.html

```
D:\My Desktop\Robot Project>robot experiment1.robot
=====
Experiment1
=====
Verify Login Page Elements And Input Data :: Opens the browser, in... | PASS |
=====
Experiment1 | PASS |
1 test, 1 passed, 0 failed
=====
Output: D:\My Desktop\Robot Project\output.xml
Log: D:\My Desktop\Robot Project\log.html
Report: D:\My Desktop\Robot Project\report.html
```

Screenshot 3: Terminal Output

Brief Result: The script successfully launched Chrome, navigated to SauceDemo, verified the login button existed, and inputted text.

Observation: Selenium Library translates keyword-driven English-like syntax into Selenium WebDriver Python commands seamlessly in the background.

Conclusion: Basic keyword-driven testing reduces the complexity of writing automation scripts by abstracting the underlying code into readable actions.
