

Experiment 4

Module Name: Automation With Selenium

Experiment Title: JavaScript Alerts and Confirms

Problem Statement: Handle different types of browser-level JavaScript pop-ups (Alert, Confirm, Prompt).

Objective: To use driver.switch_to.alert to accept, dismiss, and inject text into JS pop-ups.

Tools, software, and concepts used: Python, Selenium, Alert interface (accept(), dismiss(), send_keys()).

Source code or implementation steps:

```
import time
from selenium import webdriver
from selenium.webdriver.common.by import By

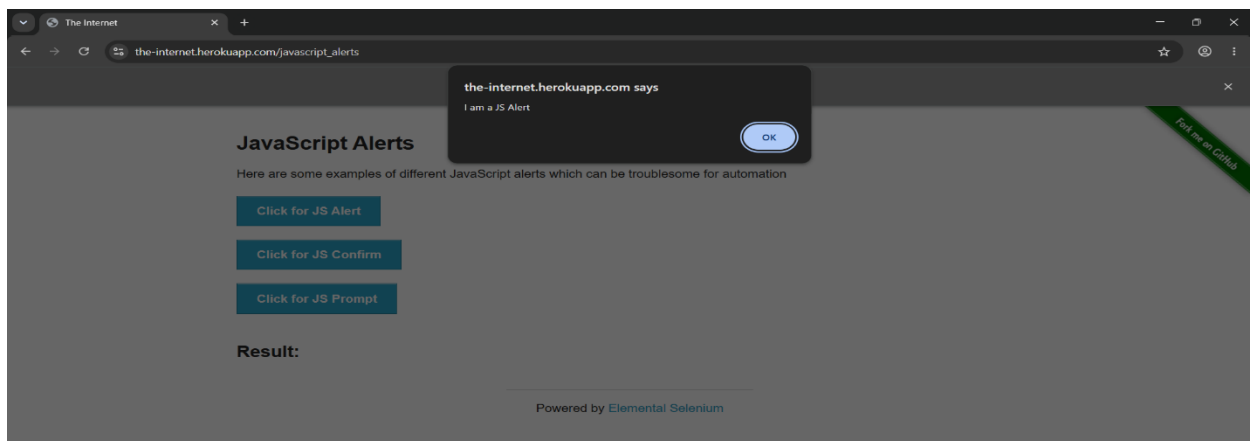

driver = webdriver.Chrome()
driver.maximize_window()

try:

    driver.get("https://the-internet.herokuapp.com/javascript_alerts")
    # 1. Standard Alert
    driver.find_element(By.XPATH, "//button[text()='Click for JS Alert']").click()
    alert = driver.switch_to.alert
    alert.accept()
    # 2. Confirm Box (Dismiss)
    driver.find_element(By.XPATH, "//button[text()='Click for JS Confirm']").click()
    confirm = driver.switch_to.alert
    confirm.dismiss()
    # 3. Prompt Box (Send Keys)
    driver.find_element(By.XPATH, "//button[text()='Click for JS Prompt']").click()
    prompt = driver.switch_to.alert
    prompt.send_keys("Automated Test Input")
    prompt.accept()
    # Verify final result text
    result = driver.find_element(By.ID, "result").text
    assert "Automated Test Input" in result
    print("All alerts handled successfully.")

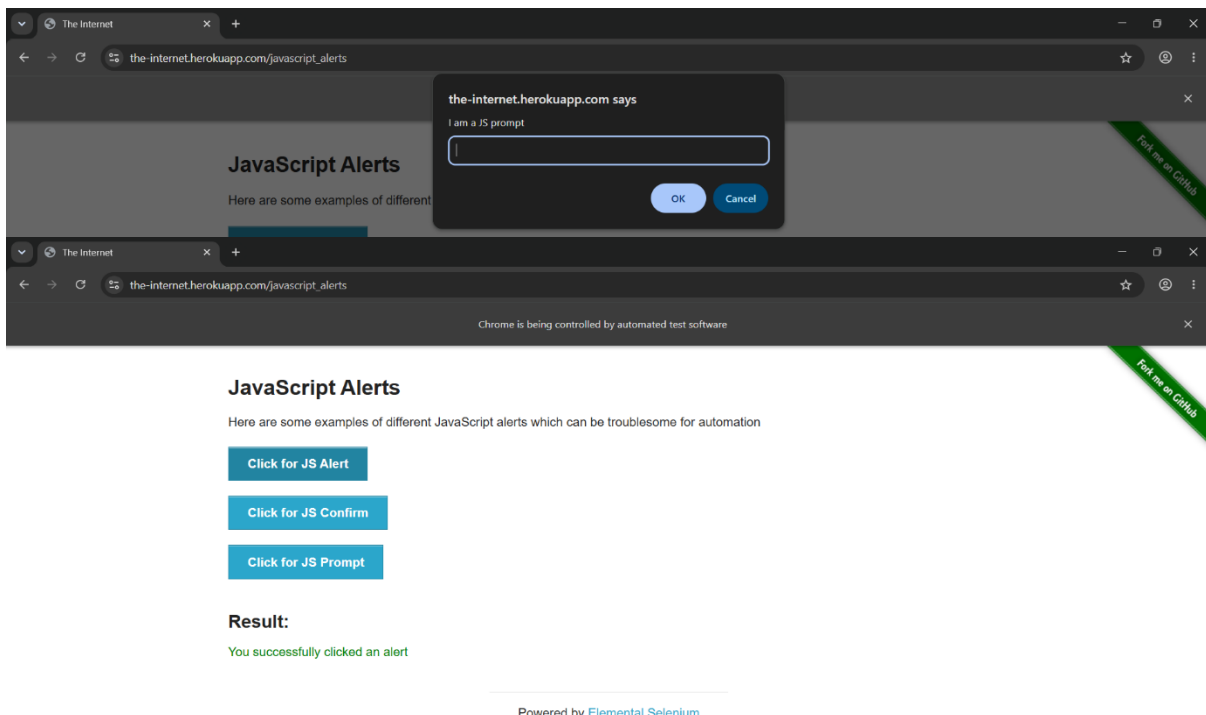

finally:
    driver.quit()
```

Output with clearly labelled screenshots:

Screenshot 1: JS Prompt visible on screen

Brief result, observation, and conclusion:

Screenshot 2: Result text showing "You entered: Automated Test Input"

Console Output: All alerts handled successfully.

Result: Script successfully interacted with browser-native dialogs that cannot be inspected via standard HTML DOM.

Observation: WebDriver must explicitly switch focus to the alert object before any commands can be issued, otherwise, an `UnhandledAlertException` is thrown.

Conclusion: `switch_to.alert` is the mandatory mechanism for JS pop-ups.
